Steel industry should be based on the domestic mining and control of iron ore resources of the initiative by Sally

Article published on December 6th 2011 | Advertising

In recent years, domestic and foreign iron and steel enterprises in the three major mining companies struggled to break into the negotiations, a second passive acceptance of the three major mining companies unilateral price increases and helpless. Blind pursuit of its iron ore negotiations empty-handed the right to speak, based on the domestic steel industry as mining, iron ore resources to seek control of the initiative, so that "the hands of food, hearts do not panic."

Iron ore crushing process generally uses a feeder, the first break (jaw crusher), the second break (cone crusher), screening, crushing (impact crusher, sand making machine), select it dry several processes, for economic reasons, usually dry sorters into the finer particle size of ore, iron ore is dried with the higher proportion of elected. In iron ore production process, without energy-efficient equipment, crusher, stone crusher equipment, and screening equipment. Meanwhile, in order to reduce iron ore mining and beneficiation processing cost, energy efficient crusher is more important. As Vico Heavy mining machinery manufacturer, has been pushing crusher, stone crusher, sand making machine, screening equipment, production, R & D and export, the production of cone crusher, cone crusher, especially Simmons, Cone breaking, etc. can be processed very hard rock, hard rock crushing of the unique advantages and processing of iron ore, may be the depletion of natural resources to a minimum.

Focused on iron ore mining machinery and equipment for R & D, production and sales of mining enterprises, in turn is a major test. China's iron ore grade is generally low, the domestic iron ore beneficiation processing companies need a lot of iron ore, in order to isolate the economic value of the iron powder, the future development of China's iron ore and energy saving will inevitably move towards intensive the direction. As a manufacturer of mining equipment, Vico Heavy Industries will continue to increase research investment, adhere to independent innovation, to develop technological innovation differentiation strategy to enhance the technological content of products to better serve customers, to build Veken Heavy Mining Machinery the brand. I believe these moves for China's iron ore mining industry will be driven by a force stronger than ever.

Over the past 10 years due to rising iron ore prices of foreign and domestic iron mines have a mining value. In the first half, the international iron ore price trend was upward shock, by the international economic situation is not optimistic about the second half in the international iron ore price shocks may be down, but the average price should be maintained at 150 U.S. dollars / ton. In the long run, international mining companies behind three large consortia control, its dominance is difficult to shake the short term, the collapse of the iron ore price is unlikely style down. Thus, the domestic mining should seize the favorable market conditions, change "steady" to "fast flow of water," "open a mine fast" rapid increase in domestic iron ore production.

Also should be noted that, due to rising iron ore prices in recent years, the domestic state-owned, private capital and international capital moving into iron ore mining industry, the next three to five years focused on the release of iron ore production capacity. Meanwhile, the total domestic steel production under control, iron ore mining industry will face more intense competition. Therefore, the current domestic mines should assess the situation, seize the favorable opportunity to accelerate the pace of mining.
