Proper procedure for the inspection and removal of molds

by Larry King

Article published on April 11th 2012 | Article Marketing

Molds caused in homes cause serious health problems as they create allergens and in some cases toxic substances. Molds can create breathing problems and trigger allergic reactions in adults and specially in infants. The basic reason behind the formation of molds is previous water leakage that leaves some portion not properly dried. High humidity level in houses or buildings can also result in mold formation. Whenever one notices a mold, the best bet is to react immediately as mold never stops by itself and keep on increasing until it is properly treated. Some people try to cure the mold by themselves by cleaning it with soap, bleach and water. However, it only cause the mold spores to get air and they spread further more with greater speed, which also increases the chances of illness and further damages the property.

In order to grow and spread, mold only needs organic food source and moisture. Many times people never see a mold, but they can only suspect it by the physical symptoms on the dwellers such as sore throats, headaches, runny nose sneezing, rashes, migraines and respiratory problems. In these kind of situations when you see a mold or suspect it, you should immediately contact to specialists that have experienced and qualified technicians that can cure the problems with their state of the art tools and machines. In this article, we will discuss the procedure of mold inspection, removal and the equipments used in it.

Mold Inspection

As stated earlier, whenever you suspect a mold the first step is call the professionals and get you home, office or building inspected. The specialists will find the mold and will estimate the damage done and will define the strategies for mold remediation in Toronto. For the inspection of the mold, the property specialists will use the combination of different tools to quickly find it.

â€¢ Visual inspection is the first step, the professional mold removal technicians will visually inspect the whole property and will look for any visible signs of mold.

â€¢ After visual inspection, the technicians use infrared scanning that detects temperature differentials and identifies the affected place.

â€¢ Moisture meter is another tool for finding molds. This meter displays the moisture level of the building materials, and clearly distinct the affected place and also indicates the level of damage done.

â€¢ Some places are closed and need major drilling or cutting to access the affected area. to avoid unnecessary drilling, the companies use borescope that is a handheld snake camera to see tight spaces.

Mold sampling

The best way to fully cure the mold is to take the air and swab samples. Only highly qualified and professional property restoration specialists like All Above Emergency Services can do this task. They use special testing equipment that enables them to identify the type of mold and thus develop baseline for air quality. all samples are sent to laboratory for testing purposes and the result help technicians to determine the best plan for remediation. After the full remediation, the technicians will again take air samples to ensure that all problems are resolved.

Mold removal

Always remember to hire IICRC certified technicians for Mold Removal Services in Toronto. Certified technicians know all the ins and outs of the molds, adopt various safety measures, and use personal protective equipment for safety of clients. Before any mold removal effort, the source of mold formation should be addressed, that is moisture. The experts use following methods to ensure no further mold formation.

â€¢ They first use sheeting and tape to make a containment room to avoid the spreading of mold spores.

â€¢ Using air scrubbers with HEPA filters ensures that no airborne mold spores are left.

â€¢ If the molds are severe, they will remove all damaged area such as drywall and wood etc.

â€¢ When all the molds are removed, the technicians clean the materials and other building area from HEPA vacuum to disinfect the area.
