The Greatest Online Business Ideas You Could Capitalize on by Karina Ivester

Article published on June 27th 2012 | Business

Youâ€™re perhaps either in your own home or at an internet hotspot such as a kiosk if youâ€™re reading this article online right now. There is no distinction in the idea of surfing the Internet, wherever you are at this moment. In fact, given the rising number of internet surfers yearly, hotspots might be the next big thing in coping with the demand.

The International Telecommunication Union (ITU) estimated that the volume of Internet kiosks all over the world will skyrocket by 350 percent. By 2015, the number of public hotspots is estimated to grow to 5.8 million from 1.3 million in 2011. In fact, more and more

a growing number of people now bring their laptops and tablets to hotspots in shopping malls and other public places to take a look at their Facebook or Twitter accounts. This is due to a groundbreaking development that allows multiple users to log on to the Internet simultaneously - without cables.

This is called wireless fidelity, more commonly known by its shortened version â€œWi-Fi,â€• and as the name suggests, itâ€™s Internet with no wires. Rather, Wi-Fi technology employs signals to deliver internet connectivity to a system capable of catching such signals. Most electronic gadgets these days can use these signals, permitting quick access to the Web.

The heart of the Wi-Fi system is the wireless router, a device that delivers and disperses data to and from the apparatus. In most cases, the WiFi router may also serve as an invisible bridge between multiple gadgets. As a result, Internet users can share data with each other so long as they are within reach of the mobile hotspot.

Internet kiosks with Wi-Fi functions will undoubtedly be the newest trend in the near future, as market demand increases non-stop. In the same figures, the ITU also made a projection that smartphones like the iPhone or BlackBerry will outnumber laptops in no time. As of the researchâ€™s timeline, laptops make up 48 percent of the overall number of connections to hotspots. Smartphones, on the other hand, are trailing not far from laptop computers, making up 36 percent.

If you are caught in a rut about the most efficient online business ideas to venture into, give kiosks a try. In the future, the whole world will be connected more and more by radio signals and airwaves rather than miles of cables and wires. The router is the ultimate example of equal access to the Internet for every tech-savvy individual.

To find out more on the future of a Wifi hotspot, check out the ITUâ€™s main web page at ITU.int. You can do additional research on the newest wireless technology at the official web page of the Wi-Fi Alliance at Wi-Fi.org.
