Article published on May 9th 2012 | Business

Nanoparticles are nothing but the microscopic particles that are the extracted substances of certain material with dimension between 1-100 nanometers (nm). Well, for those who do not know â€“ a nanometer is equal to one billionth of a meter! I guess you can now realize it that how small these nanoparticles really are. Well its lower size limit helps to distinguish a particle from random clusters of atoms. However, its small size existence makes these particles so interesting to scientist. Well, sometimes due to its size, the results associated with such substances come differently and hence it occurs more appealing to scientists.

However, this is not the only reason that it has able to fetch attention of many researchers! Another most amazing property of such substance is it has relatively larger surface area compared to their volume and due to that larger exposed surface it is chemically more active.

Nowadays the use of gold nanoparticle silver nanoparticles have become an integral of research, as these are now widely being used in different manufacturing, medical and various other places for making job done.

Well, as said, the use of such substances is growing day by day and it is obviously due to its property. So if you are one of those do very much aware of its value and know how to implement these for better use of these then you can buy these nano substances from non-other than ssnano.com.

For your brief knowledge â€“ Ss Nano is the leading seller of high purity nano substances; you can log on to its website and can make purchase of your desired nanoparticles such as gold nanoparticle, silver nanoparticles at reasonable price. So if you do really want to have these substances for your use then log onto ssnano.com to place your order.

Brown Moore - About Author:
Brown Moore is a scientist and a passionate writer. In this article she tries let you acquaint with Nano particle or say, a silver nanoparticles its properties.

Article Keywords:
gold nanoparticle, silver nanoparticles
