Grow Your Business with Alternative Fuel Options from Green Alternative Systems by 1300golimo

Article published on December 21st 2011 | Business

In the modern age of environmentally friendly businesses, transportation fleets know that purchasing an entire stock of vehicles would expend too much of the budget. Alternative fuel options can still be achieved through fuel conversion systems; a cost-effective and efficient way to offer customers the green initiatives that they are demanding to see across businesses and industries throughout the country.

Alternative fuel options can include compressed natural gas [CNG], Liquid Propane Injections [LPI] or Bi-Fueling systems. With these conversions, businesses can save costs, improve the lifespan of their vehicle and satisfy the demand for greener business practices.

The Benefits of Fuel Conversion for Transportation Fleets

1. Reduced Costs

Converting from diesel or gasoline as a fuel source to liquid propane, compressed natural gas or by combining traditional fuel with CNG in a bi-fueling system will reduce costs throughout the enterprise.

Alternative fuel systems reduce the cost of fuel and improve the functionality of the vehicle, increasing its lifespan and minimizing the number of times that the vehicle has to be serviced throughout the year. When this, in combination with every vehicle in the fleet with a conversion system accumulates, thousands of dollars can be saved annually. This level of cost-effective operations can potentially grow transportation businesses and allow for expansion, through the purchase of more vehicles, or opening a new facility.

2. Increase the Lifespan of the Vehicle

Alternative fuel sources burn cleaner and are not as hard on the vehicle as gasoline and diesel fuels. When a company can extend the life of its vehicles, even by a year, they can use their budget for other necessary business functions such as advertising, training and certifying. Alternative fuel systems are an affordable option, rather than purchasing greener vehicles. The benefits make the investment noticeable instantaneously.

3. Fulfill the Demand for Greener Businesses

There are customers that will choose a green business over another company that has not yet caught up with the demand. Minimizing the carbon footprint and reducing harmful emissions into the atmosphere can easily be achieved by converting fueling systems. With this change, transportation fleets can advertise their business based around these changes and highlight the benefits which include safety and environmental preservation.

Being a green company will grow any business with an increase in contracts, retaining the client base and by gaining exposure through environmentally friendly business networks.

Converting fuel systems is safe, affordable and has significant advantages to transportation fleets that require a green solution for the vehicles in their care. Converting to an alternative fueling system will reduce overall company costs, extend the lifespan of the vehicle and assist the business

with obtaining new customers.

Green Alternative Systems is a company that provides alternative fuel options to the transportation industry. They offer compressed natural gas [CNG], bi fuel and Liquid Propane Injection [LPI] conversion systems. The team is knowledgeable, certified and only offers state-of-the-art conversion products. For more information visit, Greenalternativesystems.
