Petroleum production made easy with vacuum insulated tubings and insulated coiled tubing

by Julia Bennet

Article published on February 15th 2012 | Business

Petroleum extracting companies are some of the most technology heavy companies in the world. The work of extracting petroleum from below the earth surface is an arduous task and can be handled only by experts. There are some companies that help the petroleum companies increase the efficiency of their work and minimize their losses during production. Some of these companies manufacture vacuum insulated tubings and insulated coiled tubing, items that are absolutely essential for the petroleum extraction process.

One of the most common problems that petroleum extracting companies face is lower productivity. This happens because the huge pressure inside the wells leads to loss of crude petroleum. Moreover, without adequate heating inside the well, waxy oil is extracted and the specific flow rate is also lower. With the state of the art technology available from the makers of vacuum insulated tubings and insulated coiled tubing, all these problems can be taken care of and the production of oil can be made faster and more efficient.

The way these companies use their vacuum insulated tubings and insulated coiled tubing involves inserting them into the wells. Heat is then passed through these tubes and this heat then increases the temperature inside the well. This increased temperature then reduces the pressure loss inside and also melts any wax depositions in the oil. Thus the oil loss due to pressure is taken care of and better quality crude oil is extracted because the wax is melted away. Moreover, the specific flow rate is increased. This means that more barrels per day and per meter of formation can be produced.

Many a times petroleum extracting companies need to extract crude oil from waxy oil wells. These are wells that have a large deposition of wax in the oil. With the use of vacuum insulated tubings and insulated coiled tubing, these wells can be unplugged and the production process can be made better. As a result, less waxy oil will be extracted and production will become easier.

The good news is that there are very specific and niche companies that are engaged in the production of vacuum insulated tubings and insulated coiled tubing. Therefore, for a petroleum extraction company there is not much searching that needs to be done to finalize their vendor for vacuum insulated tubings and insulated coiled tubing. And this world is so small that word of mouth does the entire trick. If one company producing vacuum insulated tubings and insulated coiled tubing is doing well for one client the chances are high that their services will be requested by another client.

All of us know that the petroleum reserves of the world are dwindling at a rapid pace. There will come a time when there will be no petroleum and petroleum products to use. This is why it is vitally important that more efficient processes are used in petroleum extraction and production and losses are minimized. With specialized companies producing vacuum insulated tubings and insulated coiled tubing, this job can be done with ease.

Julia Bennet - About Author:
For companies engaged in petroleum production, it is very important that they are able to work safely and by minimizing losses. a Vacuum insulated tubings and a insulated coiled tubing are perfect for these purposes.

Article Keywords:
Vacuum insulated tubings,insulated coiled tubing
