Article published on April 16th 2012 | Business

Sensitive data requires responsible handling. Loss, misuse and modification of critical data can affect the privacy and welfare of an individual or a company. To help prevent information theft, data warehouses and data management services provide secure methods of data management.

Every technology we have today involves a lot of data, from the emails we send or receive to various files we download on our computers or mobile devices. Digital data are represented by bits and bytes unit of storage and can be considered as either classified or non-classified information. Public, personal, routine business and confidential business information all fall under non-classified data, although they still require protection. Classified information, like top-secret government dossiers, requires maximum security.

Data that belong to private individuals may be shared for personal or business reasons, while routine business information may be shared with anyone inside or outside the business. Meanwhile, confidential business information may not disclosed to the public require more stringent security measures. After all, disclosure of such information may do great damage especially if it falls into the wrong hands.

Data warehouses protect valuable information and enable easy data retrieval. They collect data that are either historical or continuously useful. Data warehouses are considered more reliable than physical storage, which can be corrupted after some time.

Data management services typically provide catalogs, which contain useful information about where to find practical data. Catalogs are mostly metadata (i.e. data about data) and hold information about items like, say, books or movies which have listed information about authors, directors, and synopses. Digital collections of images, sounds, movies, and screenplays by Hollywood production studios can also be stored. These may have limited distribution due to intellectual property laws, though they can be used in the future by data recovery Los Angeles organizations may need.

Useful information like statistical data that contains a mixture of current and historical information can provide data on trends and populations. It is useful to determine the people who will require government services such as pensions or schooling. Historical data mostly valuable for organizations are also stored for later data recovery Los Angeles has, because they contain important information that may be referenced as the basis for decision making.

These data are stored in vaults provided for later data recovery Los Angeles data management services has. Digital data can also be stored through a different type of network storage called cloud computing, which is done over the internet. This way, an unlimited history of the files may be maintained and would require only a few encryption procedures to provide extensive security over data and devices.
