Know Your HDMI over Cat5 System by Julia Roger

Article published on May 17th 2012 | Advertising

You know that HD TV is quite popular in the market today. It is known for delivering high quality picture and audio with technology that is quite advanced and can be easily called ahead of time. There are technologies that can send HDMI signal over long distance. It is possible to have reduced quality of HD after this long distance travelling but technology has advanced enough to keep the quality standard same. One such is hdmi over cat5.

The system is a complete solution for high quality HDTV signal delivery. The signal needs to transport the high resolution audio and video from the source to the destination. The transporter that we are discussing now has two cat5 wires which are capable enough to do the needful. The transmitter changes the signal to a differential signal that is balanced and at the receiving point of the signal it gets converted to the HDMI signal again. It is possible to use other cables for this purpose but the major problem with them is that they are so expensive that the cost of the television and the transporting technique would be quite high. Cat5 cables are cheap and flexible making it possible to enjoy good quality output at the cheapest price.

The transmitter with its cable can improve your TV viewing experience without making it much costly. It can transfer 1080 pixel output at 30m which is not quite bad. You can get more distance coverage with higher quality of the device. They generally cost a bit high than the general versions but the output is always good. Always use the branded thing in order to get the assurance of warrantee in case you face any problem with the device.
