Factors Considering Water Well Drilling Michigan & Water Well Repair Michigan by Ayerswaters@gmail.com

Article published on May 3rd 2012 | Home Improvement

There are certain questions youâ€™ll want to ask and certain factors youâ€™ll want to know about if youâ considering water well drilling or water well repair, in Michigan or in whatever state you live in. There are quality water well drilling companies in your area, but make sure you talk to them beforehand and make sure that they are knowledgeable and confident in their work in your area in particular. This article will lay out some of those issues youâ€™ll want to take into account before, during, and after the hire of your water well drilling company. You want to make sure the repairs that are done are effective and necessary.

There are different types of wells out there: dug, driven, and drilled. Make sure your well repair company knows what is appropriate. A dug well is a large hole that is made by hand and will be over two feet in diameter. If you have a dug well, youâ€™ll want to be extra careful, seeing that they have the highest risk of being contaminated; they are closest to the surface and are not very well protected from ground water. Water well drilling is something you donâ€™t want to mess around with if you donâ€™t know how good of well driller you have. If the company is casual and inexperienced, you can end up with dangerously contaminated water supplies coming into your house, your shower, your bodies, your food, your children. Well drilling is used to help repair water supplies, but also if the company is careless, they can contaminate your supply! Ayers Water Systems of Michigan is so careful at all times to create the best drinking water circumstances available for your given circumstances and location of your water well.

Driven wells will usually be 50 feet or less deep and are usually installed only in areas of relatively loose materials such as sand. These wells are somewhat at risk as well to being contaminated because they are also somewhat shallow. Then there are drilled wells, which are the least likely to be contaminated and therefore usually they are the safest wells youâ€™ll findâ€”in MI and in most other states.

They should have a casing on them that helps to protect the water from contamination.

A good well-drilling company will be aware of the age of your well. If they are coming only to repair the well, they should find out how old it is. The older the well, the more likely it is to have something wrong with it, such as the groundâ€™s slope having changed over the years, or being too closely located to contaminants. Itâ€™s likely that the terrain has changed and will need some modification to bring the well back into good repair.

There are companies who deal with water filtration and health in Oakland and Wayne County, MI. Check out your local resources to find the company who will serve you best and most responsibly!
