The vital elements which are required for any living human being are air, water and food. The abovementioned three elements should be made available to any person in pure condition so that the person can live a healthy life.

On account of automatic mechanism available in the body, once air is inhaled into the lungs, oxygen is separated from other components available in air and oxygen is responsible for purification of blood which in turn helps removing the unwanted cells from all parts of the body. However, on account of obvious reasons, some people are found to be suffering from lack of oxygen and they may be old or young and under such circumstances, there is no other way except to depend upon the oxygen concentrators which can be procured from the markets.

In fact these types of oxygen machines are available in different sizes and colors suiting to the requirements of the clients and in certain situations, for the patients who are in need of oxygen continuously throughout the day uninterrupted supply of oxygen is a must and for this purpose many facilities are available and the experts who are talented in providing such equipments are installing the oxygen generators in the houses and through pipes the regular supply of oxygen is monitored so that the patient gets the required quantity of oxygen continuously.

In order to understand the concept, it can be well imagined about patients undergoing medical treatments in hospitals and at periodical intervals they used to fix the oxygen mask on their faces for the purpose of getting oxygen as and when they want. At present in order to obviate the abovementioned difficulties, people need not visit the hospitals and stay there permanently; however, they can comfortably relax at homes and can even perform their duties apart from getting the oxygen supply on a regular basis through oxygen concentrators.

Apart from hospitals and houses where the facility of providing continuous supply of oxygen can be made possible, for people who are on move to various places by road, rail or air on account of some important preoccupations, necessarily help from oxygen machines is required and in order to obviate the abovementioned difficulties, nowadays the concentrators are available in different sizes which can be comfortably carried by hand and they can be kept in mini trolleys fitted with smooth wheels and nowadays many airliners are allowing the passengers to have the oxygen machines by their side during the course of their travel.
