When Your Decision Matters by Shaly Criston

Article published on February 4th 2012 | Internet

Ever heard of a dedicated server? Wonder what it actually means? When it comes to choosing a certain dedicated server for your company how would you know where to turn to? Well firstly letâ€™s clear out what a dedicated server actually is!

A dedicated server is defined as a very powerful computer, which is used exclusively as a network server. It describes the restricted use of one computer which is used to control a domain or a server. For the use of one exclusive group or organization, it is leased & saved in the data centre of the host company. A dedicated server usually contains the following: an operating system & a connection to the internet which are all kept in the web hosting companyâ€™s data centre.

Why do these exist? The requirement for this usually occurs in cases of websites or related company sites, anything that creates a great amount of traffic. These servers can be designed and controlled by the host company while it would still allow its clients to change and control some data. A server is owned by the web host, clients do not have physical access to it. However, the need of purchasing occurs only when a company wants more access and control of their server. For which they contact their hosting company.

Even with this hosting there are two types:

Managed and unmanaged, as you must already get a brief idea by the names itself unmanaged include hardware, operating system, web server and Internet. Managed only include the basic requirement.

The main question is, what do you actually consider when choosing a specific dedicated server when a company wishes to purchase a specific kind. It looks over several dedicated servers, going for something cheap may put one in loss. Thatâ€™s why one needs to be very careful when comparing different packages. The main things to mull over are the operating system, date backup, monitoring service. Space is very important and of course the technical support one would get with it. One should do thorough research well in advance, look for the reviews, ask them to provide you with a few websites for references and do make sure the price fits your budget.

The different range of dedicated servers may confuse the person a great deal but it is all about making the right decision, since oneâ€™s server performance depends on this. Once the person has the right server it makes things a lot easier and applicable to any desired change. Nowadays companies have a lot of trouble finding a reasonable price for a good server so make a plan, research, inquire and youâ€™ll be good to go.
