Artificial Golf greens- a nice way to enjoy the game at home by Danial Martin

Article published on April 27th 2012 | Customer Service

A golf putting green in the backyard is somewhat a treat for the keen golfer who is eager to have private access to a green, whenever he or she wants to go out. The greens are actually quite complex and must be designed, installed and maintained properly or they simply will not last. This is fabricated from the bottom up and should be prearranged perfectly in order for the finest putting surface to be created. One can build it with a little bit of effort and careful safeguarding that will be more than functional.

Golf greens are usually built up on a sandy soil support. Sand is not a water friendly support in any way. Drainage will have to be dealt with, because of this requirement for a sandy base. Any other base will not work as sandy soil will be required to keep up the form and arrangement of the greens whereas allowing it to hold up to the heavy foot traffic that is natural.As a result, drainage has to be concentrated on. Allowing extra water to build up will cause puddles which make it not feasible. Consistently having puddles will lead to infection and rough growth and will sooner or later spoil it. By building the green so that it is fairly above the level of the rest of the lawn, on a raised bed if you can, will make the golf green to drain more easily. Adding up a slender slope to it will also help in water rolling off and draining down into the rest of the backyard.

Being just a golf fan is not enough of a drive to put up your own green. The owner of a home golf green should be similarly avid regarding lawn care and farming, and should not be one of those people that cannot grow a thing. Preferring a suitable seed, fertilizing, appropriate cutting, killing weeds, and keeping an eye on bug and other troubles are all part of the job when one has a home putting green.

There is one other option for somebody who undeniably wants golf green but cannot gather the gardening abilities to build their own grass-covered retreat. A fake turf can be very good. Once it is built, this call for extremely low maintenance. There will be no cutting and no watering problems. Artificial grass is nowadays accessible, specially designed for putting greens. This artificial product merges so well with the lawn and gardens around it that friends and relatives will be completely ignorant and everybody will consider that owner is a gardening and golf putting green mastermind.
