Contents of Some Scaffolding Training Courses by Czeslawa Wakefield

Article published on August 24th 2012 | Education

Those who are interested in the right scaffolding training courses should check out the industry approved CISRS courses which are widely available in the market.

Basic Scaffolder Course

The CISRS scaffolder course is a basic one day skills course which includes an acute assessment of the candidate. Those who have already undergone the CISRS scaffolding training of parts 1 and 2 are eligible for this one day skills test course as they are usually working at work at height jobs.

The course content basically assesses the candidateâ€™s competency in interpreting work instructions and deciphering information which would not be a problem if they are familiar with their on-site responsibilities and having applied the course contents of scaffolding training parts 1 and 2 diligently.

Candidates would also be tested on understanding the material list and statement on methods; their skills on components selection and checking would be assessed to confirm their competence. They would also be practically tested on the erection and dismantling of various types of scaffold such as cantilever scaffold.

CISRS scaffold courses

It is a legal requirement that any erection, alteration and dismantling of scaffolding must be handled by a qualified person who has undergone the appropriate training such as CISRS scaffold course. These are held in two parts; both courses are conducted on 10 consecutive days.

A successful completion of these scaffold training courses would qualify the candidate with an industry approved certification to handle scaffolding works or to supervise such works at the work site.

The CISRS scaffold course of part 1 is the basic scaffolding course which allows the candidate to understand the statutory regulations of scaffolding works with the current Codes of Practice. There would be the practical sessions of erecting and dismantling of scaffolds from basic to complex natures.

Independent scaffolds with bridging would be taught with various components used in the industry such as truss out, cantilever drop, roof saddle, gantries, sheeting and safety harness. There would be a great emphasis on safety and health issues as a reminder and caution to candidates on the possible dangers and risks that lurk around the work site.

Hence, the PPE is necessary to be worn as a safety requirement during the course.

When the successful candidates have at least 6 months of work experience, they can proceed to the part 2 of the CISRS scaffold course. This course is also 10 days long with a maximum of 12 candidates to ensure a good ratio of machineries to candidates in the practical usage of equipment.
