Article published on February 14th 2012 | Email Marketing

An SMTP or Simple Mail Transfer Protocol is an internet system which handles data from one place to the other. This is often used by users during emails when a server related to the SMTP mail is used. The whole scenario resembles road traffic. With better technologies the speed is enhanced, making emails the best option for sending mails.

The system was started for public use from the 70s. Before this, scientists were trying to develop something which would help users to quickly deliver mails. US governmentsâ€™ ARPANET came up with a solution but was restricted to government users. Finally these protocols were used and are on offer today.

Through SMTP, a simple yet complex structure is followed. The moment a client sends an email, the link is created with the other client/s. Thus a network is created through channels. Through these channels, the data are sent and clients can receive them. If one of the channels is busy, the data are sent through other ones. Depending on the traffic, the SMTP mail servers act and deliver the messages.

These are now extensively used by people everywhere specially companies. As hundreds of employees are continuously using the same, a backup system is required in case there is a fault. This has proved to be the most effective way of marketing a product and so the protocols need to be hassle free. Each SMTP mail server has its own capacity of handling the mails.

In case there is an overload of data, two things could happen. One- the system can break down. Thus a backup model is required immediately. Two- the transfer of mails or data takes a long time. Nowadays the second option happens a lot instead of the first as newer technologies are put into use. In the future theses problems would be eliminated as well. However if any of the two happens, a disaster will occur as a number of people rely on the data.

In case you are facing trouble at home here are some tips- choose Tools option and then select Account settings. Select your mail and then click on the mail account and change. Modify the account and click on the Outgoing server tab. Disable the current authentication and change the port numbers. Click on OK to complete the process. The SMTP and SMTP mail settings are thus so simple and easy to work with.
