The Risks of not undergoing Electrical Test and Tagging by Jamess William

Article published on July 20th 2012 | Advertising

Whether you stay at home or work in an office having your electrical equipment tested is of utmost importance. Through this you can guarantee that your place is a safe place to live in or work in. electrical test tags are not required to be done every single day, different work or living environments have different requirements when it comes to frequency of testing and tagging which will also depend on the number of equipment used in an area. Most extreme work places such as construction companies and public places such as commercial areas like malls and amusement parks work around the clock which is why they need the most attention when it comes to safety checking.

Some companies would pass when it comes to having regular test and tag sessions because of reasons such as the expensive costs; some are just negligent and forget to do it. No matter what the reason is, it is unacceptable. Institutions and even homes should always have a regular appliance check. Some of the bad side effects of not having a regular testing or tagging of electrical equipment can lead to:

May receive penalties and fines from the authorities

Companies such as those in New South Wales can be penalized ig their electrical equipment do not undergo regular testing and tagging. Those who do not undergo electrical tagging in NSW will be deemed unsafe and may even cause unwanted accidents to innocent employees or civilians staying in the area. Bigger institutions and companies needs to pass the safety standards set by NSW and one way to prove that a company is safe is through undergoing a regular testing and tagging of equipment.

Can cause unwanted hazardous events

One of the main reasons why testing and tagging is done is because electrical equipment are highly dangerous especially if they are not checked on a regular basis. Each company should pass the standards mandated by the National Test and Tag authorities in order for it to be deemed safe for use. If a company is proclaimed safe after testing and tagging only then can a company operate and let its employees sue the electrical equipment.

Production loss

If your company has not undergone regular testing and tagging some electrical equipment can go haywire and break down or even harm other people. Because of this production can be affected since there are less equipment being used and fewer people to do the job.
