What is Thermal Imaging? by Jamess William

Article published on July 20th 2012 | Advertising

We often see thermal images in movies or reality shows wherein scientists or researchers use a camera that can detect any living being and shows off an array of colors that we barely understand. This is called thermal imaging and is used at night to track or see any living beings in the night. Most living creatures would give off heat or thermal radiation. Some consider this as the best form of night vision since anything that can emit thermal radiation or heat will show bright colors on thermal imaging. The brighter the colors are such as orange and yellow the more heat is being emitted.

The first question to ask is why do we need thermal imaging? Here are the top three uses of thermal imaging services and why we need them:

Surveillance

Night vision is quite hard to read especially if you are not so used to it. It may show more distinct footage but people can be harder to distinguish especially from afar. Thermal video is important especially when a certain area is under surveillance. With the help of thermal video, it keeps the bad guys out, such as intruders and possible burglars and keeps some of the people in, such as prisoners. Through thermal imaging, no matter how far and small anything is, it can still be detected and can still show up on the screen as a colorful moving object. If you have no thermal video cameras, you can always seek the services of thermal imaging Brisbane.

Search and Rescue

Aside from keeping the bad people out, thermal video can also help search for missing people especially in dark and uncharted places such as the forest. This is helpful for search and rescue missions done at night. Aside from Brisbane, there are also service companies that offer thermal imaging in Melbourne. This is usually sued by police and members of the search and rescue team to fin certain missing people.

Office and Home Safety

Thermal video can ensure your safety whether you are at home or at the office. Company that offer thermal imaging services can detect is there is suspicious movement within a home or a workplace. Although this option is hardly ever used, it is also effective to have your home checked by someone who knows thermal video imaging in order to keep your home or office safe from unknown intruders.
