A foray in the underwater amazing world can only be done with the GoPro HD Camera! by Steve

Article published on November 23rd 2011 | Hardware

The very first thing that you will need to have with you when you are going snorkeling is a GoPro HD camera. The GoPro HD camera is the first world's camera that was especially designed for surfing aficionados and for people that want to capture their incredible underwater experiences. Even though it does not cost as much as the other cameras in its category, you will be glad to know that its optics are professional, as they are especially designed for low lights environments. In addition, they are very durable and able withstand all hazard that normally occur at 180 feet in the deep blue.

The advantage of a GoPro HD camera over any other types of cameras is that you do not really need to get that close in order to take a picture. In general, the non-specialized professional cameras that use a waterproof case will require you to be as close as one feet to your target in order to take a picture. Otherwise, the photo will just look dark and granular. However, the GoPro cameras have a fixed focus lens that allows you to take a picture from at least two feet. Consequentially, you can be sure that you will be able to take a shot of those colorful fish swimming around the coral reef without scaring them.

Usually, to get a great clarity on the underwater pictures you will need to invest in a waterproof strobe light. In case you do not use the strobe light or you forget to turn it on with a standard camera, then you will only get a dark and jumbled picture. However, you can put all this hassle behind you if you own a Go Pro underwater HD camera. Not only does it allow you to take clear picture at sixty meters deep, but you can also wear it on your head or above the diving mask and hence, you will have your hands free.

If you are taking your GoPro camera with you underwater, then you definitely need to know more about its four main modes. This underwater camera allows your videos to be recorded in several resolutions, including 1080p, enables you to take still pictures of the flora and fauna that you find underwater, it can be set to take pictures based on a self timer and it permits you to capture interval photos. Therefore, you can film your first underwater expedition, take an award winning picture that most people get to see once in a lifetime or capture the main points of your diving experience.

A trick to getting very good underwater photos is to shoot the object of interest upwards. If you hold the camera up while shooting, the items, ocean animals or people in the picture will appear to be the same size or even a little bigger than you currently see them. If you own a camera for quite some time, then you know about the importance of the perfect angle for your pictures. With the GoPro HD cameras, all you need to do is admire what you see, as setting it in interval or self timer mode will ensure that you capture the beauty of the moment.
