Advantages of Robotic Surgery for Women by Dave Taylor

Article published on April 4th 2012 | Health

Robotic surgery has made drastic and revolutionary changes in surgical operations as far as new technological developments are concerned in the field of medical science. This kind of surgery is also known as computer assisted surgery as well as robotically assisted surgery. This surgery is very helpful for women as it was developed to overcome both the limitations of minimally invasive surgery as well as to enhance the capabilities of surgeons who are performing open surgery. Nowadays, without involvement of robotic surgery, there are two to three surgeons, an anesthesiologist and many nurses to perform a simple surgery in the operation theater. Thus, we can say that there are requirement of nearly a dozen people to perform most of surgical operations.

If you are looking for the future, computer assisted surgery will ease its procedures and even one surgeon can perform any kinds of complex surgical operations. Moreover, one of the main features of this kind of operation is that it can be performed remotely. In this case, a doctor may be sitting in front of a computer console either inside the operation theater or outside it; even they may be sitting remotely and can use the surgical robot to accomplish the operations successfully. This kind of surgery is also known as telesurgery, in which a doctor performs operation on a patient by sitting at a computer console remotely (that may be long miles away).

Still, most of developing countries have not the facility of robotically assisted surgery and they are not able to get the benefits of this kind of operation. In such cases, their operations can be performed through telesurgery in which a professional surgeon performs the operation by sitting in front of a computer console in their country. Thus, citizens of developing countries can avail this facility despite the unavailability of this new advanced operation in their own country. Having fewer doctors in the operation theater and allowing them to operate on a patient from a long-distance will lower the costing of health care for the long terms perspective.

There are numerous other benefits of this surgery over the traditional surgery, which includes enhanced precision and reduces trauma to the patient. Now, there are various kinds of medical treatments and operations can be done by robotic surgery. These treatments include hormone replacement therapy, hysterectomy, endometriosis & infertility related operations, breast surgery, birth control related operations along with many others. Thus, there are lots of features involved in case of robotics surgery especially for women.
