Commercial and research industries point out benefits when consumers buy IGF1, but informed usage is necessary by Julia Bennet

Article published on April 17th 2012 | Health

For the longest time, a massive amount of money is being spend for research and development in order to increase the knowledge of the scientific community about various chemicals and organic compounds for consumer and industrial use. Chemicals come in various forms and while some of them have already been proven to be effective, not all implementations can prove to be successful. Take for example, IGF1. A very popular peptide, many companies in the health and beauty industry buy IGF1 for many reasons. It is important for consumers to also understand what the research community does.

The commercial take on IGF1

As much as we don't want to hype up any products, it is still important to be impartial about how majority of the world looks at it. According to data, it is considered an important product for muscle development, health maintenance and anti aging. According to other definitions, the IGF1 acts like an insulin growth factor and its main purpose is to mediate the growth of many tissues and effects of certain growth hormones in humans. It is also considered helpful in the development of new cells.

Why buy IGF1?

The human aging process is pretty tricky to analyze though we know that a lot of changes happen. Aging causes the body to produce less of the human growth factor necessary for human growth, cell repair and development. As such, the natural amounts of IGF1 lower tremendously. Thus, research and development experts look at the possible benefits of having this compound be used for commercial purposes to help those who might need this product. Remember, this chemical helps in transporting amino acids and glucose to the muscles and stimulates the muscle development.

A youth serum?

When you buy IGF1 based products, do you essentially get a youth serum? Remember, aging is a complicated process and as such, when you buy IGF1, you only address certain aspects like muscular and skin development but other components if the body could still be affected by our aging, like immune system or even the joints. The process of rapid development declines considerably from youth and by early 30s, it is already half the amount than in the past. It is considered a safe product even without the use of steroids and thus, a preferred solution to improve muscle development using a natural compound.

However, for commercial purposes, it is necessary to ask the help of a doctor or expert if you wish to use IGF1. The most common mistake is taking in unnecessary dosages that could have bad effects to the body. For research purposes, it is advised to check if the company is licensed to sell such products and if they offer top quality products. The cost of these chemicals can rise up to $100 for a single vial and so there should be vigilance in the purchase of any chemicals. There is nothing bad in using chemicals that have been researched and found to be helpful but it is the responsibility of both consumers and experts to know and consider the risks of misuse of the product such as IGF1.
