Emla: the perfect choice to get fastest relief at all body parts by Drnumb05

Article published on April 12th 2012 | Health

Under the brand name of EMLA (Eutectic Mixture of Local Anesthetics), two local anesthetic solutions Lidocaine and Prilocaine are mixed with equal quantities. This mixture is called eutectic because it contains chemical compounds that have a single chemical composition which solidifies at a low temperature.

These days, Emla available in many forms like solution, cream, gel but cream is mostly preferred form because it is easy to use. As we all know that local anesthetics substances use to give relief to different pains so this Emla cream is also a local anesthetic to recover from several injections and other medical procedures.

In body, pain mostly induced by the arousing of sense organs present in the nerves which causes sodium to get into the nerve at end producing an electrical sign. If the amount of signals increases at the higher level it communicates with brain to make us feel like a pain in the body. The main motive of Emla is to temporarily block the path of electric signals in the nerves by halting the sodium movement. No sodium means results in absence of electrical signal which is the main cause pain.

These days, most of the doctorâ€™s advice to adopt this Emla cream because it imparts fastest relieving action by numbing the skin. Its application mostly preferred in process of :

â€¢ Injections

â€¢ Tattooing

â€¢ Waxing

â€¢ Laser treatment

â€¢ Minor skin surgery.

Moreover, after 5 minutes of EMLAâ€™s application, you will feel the effect and it lasts about 4 to 5 hours. In grownups the cream should be applied in thick layer but before application it is recommended to ask your doctor that where it can be applied and how to apply.

No doubt!!! EMLA is securest anesthetic to utilize but excess of everything can be harmful. Before the usage of Emla be conscious about the ailments you are suffering from like:

â€¢ disease related to liver

â€¢ any past allergic reactions caused by Lidocaine or prilocaine

â€¢ During pregnancy

â€¢ Any genetic disorder

Therefore, always try to wash hands instantly after its applications especially when applied with hands. Avoid its contact with eyes, nose, ears, or mouth or any sensitive part of body. After its

application the area where you applied becomes numb for several hours .It is recommended to defend that area from any types of injury.
