Implant de Silicone has been in the news for long time now. Different parts of the body can be shaped and corrected with these implants. According to the FDA report, 20% women are not opting for silicone implant as their only resort to increase their breastsâ€™ size, while half of them choose to go for a breast reconstruction although breast implants arenâ€™t lifetime devices or permanent solutions, they have been a great way to support and correct some common complications. Protese de silicone is one of the greatest solutions that can be used through a procedure called silicone prosthesis.

Women who have always desired to have firmer, larger and attractive breast can now use these methods to enhance the overall shape and size of their brats. It is important to learn that there are several contributing factors which lead to the changes in the appearance of breasts, both its size and shape. In most of the cases, breast augmentation procedure has been successful with protese de silicone. The process involves separation of the pectoral muscles of breast tissues, to begin with. Once the isolation part is over, the Implant de Silicone is added over or under the muscle tissues in such a way so that it contributes to the shape. The structure is then sutures back. It results in barely visible scar that fades away over time.

Implantation is a surgical procedure that involves a small incision; therefore, the procedure has to be done under anesthesia. There are techniques used for sedation, and the surgery takes approximately 1-2 hours. Hospital stay will not be more than one day. However, there are rules to post-operative care, which must be followed. It takes 14 to 20 days for a woman to get back to normal exercise routine and effort.

Protese de silicone implant is a matter of choice for most women. However, the choice depends on the shape of the body and its characteristics, the shape of breast and also the coveted result. It is very important to discuss all these important issues with the surgeon prior to the surgery. While the images might seem to be quite tempting and appealing initially, but the process of getting that correct shape and result is not very easy.

Implant de Silicone often leads to the development of fibrous capsule, which is a usual reaction. As a foreign substance is entering the body, some obvious changes will be seen. The fibrousness gradually contracts to get back to normal shape. Once the implant settles down, it might cause pain and there might be some prominent changes in the shape of implant. In such cases, it should be reported to the surgeon immediately.

Implant de Silicone is an expensive procedure. Before going for the procedure, it is also necessary to know the cost and the other pointers that will make a difference.
