Tampa Doctors and the Different Cosmetic Surgery Procedures They Offer

by Geoffrey Lelia

Article published on March 21st 2012 | Health

Do you wish to achieve a curvier or fuller figure? With years of research and development, scientists and medical professionals worldwide have developed and fine-tuned different cosmetic surgery treatments to help you attain your beauty goals. If you or your friends are interested in undergoing a particular plastic surgery procedure, here are some facts about some of the most popular options offered in most medical offices today.

Breast Augmentation. With more than 300,000 surgeries carried out each year using this technique, breast augmentation is considered one of the most well-liked plastic surgery choices among American women. This operation improves and reshapes breasts through implants. A breast augmentation surgical treatment may incorporate breast lift, or mastopexy, to eliminate sagging typically induced by weight loss, aging, or pregnancy. Performed by a competent and seasoned plastic surgeon, this procedure can restore your breasts' firmness and youthful look.

Rhinoplasty. Most people, regardless of gender, are self-conscious about their nose. With the proficiency of a board-certified cosmetic surgeon, you can enhance your nose's size and shape and enjoy a more proportional nose. In rhinoplasty or nose surgery, the nose's cartilage and bone are reshaped, restructured, or reduced to improve one's appearance. This safe method can provide dramatic results that can boost your confidence.

Rhytidectomy. With stress and the hot Florida sun, a lot of aging individuals are bothered by long-term skin damage and premature skin aging. Face lift counters the effects of natural aging and gravity on skin. The facelift Tampa plastic surgeons offer repositions facial tissues and addresses wrinkling and sagging, thereby creating more youthful and fresher facial contours. Surgeons use high caliber surgical techniques like fat grafting and fat transfer to create positive results.

Abdominoplasty. The tummy tuck Tampa medical offices offer can make the abdomen firmer and thinner. This cosmetic surgery procedure involves removal of excess skin and fat from the patient's middle and lower abdomen. As a result, it tightens the muscles and abdominal walls and gives the torso a more fit appearance. Those with excessively stretched and loose tummy skin and lax abdominal wall muscles resistant to diet and exercise can go through this safe and effective operation.

Liposuction. People with excessive fat in their abdomen, buttocks, and thighs can choose the liposuction Tampa locals recommend. This cosmetic surgery treatment improves and refines your body shape by getting rid of unmanageable fat deposits and fatty tissues. A doctor may carry out liposuction using the tumescent method wherein a solution of saline and anesthetic targets and eliminates fat cells. Ultrasound-assisted liposuction, on the other hand, dissolves the fat beneath the skin using an ultrasound probe for efficient and fast outcomes.
