Choosing the Right Kind of Roof to Withstand Any Weather Conditions by Richard Boles

Article published on May 2nd 2012 | Home Improvement

In the world of fashion, a hat can serve multiple purposes. It may serve as an accessory to complement the design of oneâ€™s clothes, or it can make the wearer stand out from the crowd and get noticed in a particular occasion or event. In most instances, it can be just a cover or protection from the elements.

The roof of the house is also like a hatâ€”it complements the overall design of the house and makes it stand out in the neighborhood. But it also covers the house to protect it from the weather. Just like a hat, it can be subjected to wear and tear, so it may have to be repaired or replaced after some time.

Other than design and material however, a roofâ€™s lifespan depends on the prevailing climate conditions it has to withstand throughout the year. The amount and type of precipitation, temperature, and wind velocity have to be considered. A house or edifice in a dry climate does not need the same kind of roof as a building where it rains constantly.

Snow can also spread and collect in some areas of the roof, putting a heavy toll on tiles and flashings. A hail storm can also puncture the roof system, so a roof that can withstand any pressure from the elements. Roofs also contract or expand depending on the temperature, and a roof that can adjust to these abrupt changes may be necessary for any home located in areas with unpredictable climates.

Climate also affects a roofâ€™s insulation requirements. An area with prevailing hot weather conditions may need reflective roof systems to save on bills, while areas with predominantly cool weather may require structural designs to save energy. Most roofing contractors in the U.S. such as roofers in Miami install the right kind of roofing materials suitable for the weather.

Another important factor for clients of roofers Miami based companies serve is choosing the kind of roofing material to withstand wind velocity or uplift movement. This is essential in areas prone to hurricanes and other high wind events. A strong gust of wind can cause a defectively-installed roof to peel and blow out from its structure.

The prevailing climate conditions may determine the homeownerâ€™s choice for a roof material, but his building plans and the existing budget should still be a major factor. If he intends to stay longer, he may have to choose a longer lasting material and have the right budget for it. Whatever the homeownerâ€™s choice may be, roofers in Miami are always ready to serve.
