Weather Exposure and Regular Upkeep: the Factors that Verify the Lifespan of Your Roof by Brendan Gertner

Article published on February 23rd 2012 | Home Improvement

The factors that evaluate your roofing materialâ€™s lasting power include the material, underlayment, and the way it was installed. While roof replacement and routine maintenance can be controlled by homeowners, natural elements like sunshine and rain are totally out of control by humans. This article aims to explain the elements that alter a roofâ€™s lifespan.

The type of roofing material used is one factor that can figure out the roof's lifespan. Ordinary asphalt can last from 18 to 30 years depending on its material and manner of installation. While asphalt can live up to 30 years, it still very dependent on the climate that it has to abide. Wood shake is another long-lasting roofing material; it can last around 20 years. Slate, steel, and clay roofs are noted as the most resilient and can last up to 50 years when correctly installed.

Some roofing materials such as asphalt shingles are highly affected by environmental factors. It was observed that shingles that are exposed to colder weather tend to be more long lasting than those that exposed in areas with hotter temperatures. When asphalt shingles in two different locations: Phoenix, Arizona and Minneapolis, Minnesota were researched, the shingles in the colder Minneapolis lasted five years longer than those in hot Phoenix. Constant exposure to UV rays and rain reduces the lifespan of any roofing material.

People cannot manage the quantity of rain, hail, or snow that falls on their roofs (sunlight can now be governed thanks to solar panels), so it is up to roofers to install roofs that are set up to take the punishment. If you would like your roof to function ideally, installing high- quality roofing materials is a great way to start. Nevertheless, if you will reside in a home briefly or permanently, the health of your roof remains a primary issue to roofing contractors Vancouver locals suggest.

To lengthen the lifespan of your roof, you should have it examined at least two times a year. Things like tree development are able to adversely influence your roof particularly when the tree's branches reach it. If you see evident branches in your roof, you can call your Burnaby roofing service provider to aid you in the clearing job without having any physical damage or harm.

Your roofer Surrey locals count on can also examine your roof by considering curled-up edges or lost granular tiles. Having these kinds of problems will most likely result to leakage or even mold development. Expert roofing companies can give an assessment for these roofs to ascertain if they need to be mended or replaced.
