Emerald Rings: the Ravishing Rings Featuring Breath-Taking Emeralds by Vishnu Batwra

Article published on January 17th 2012 | Jewelry

Emerald rings are hot favourite among women of all ages because of their rich green colour. The ravishingly beautiful appearance of these rings separates them from other rings of the world. There is a divine charm associated with these rings, about which only the wearer has the idea. The heavenly beauty of these rings has the capability to take you on the trip to the beautiful world, the one which comprises sheer beauty. The article will help you get the perfect emerald rings out of so many rings available in the market. Reading further would help you know some useful information.

A mineral known as Beryl is used in the composition of emerald rings. The chromium and vanadium present in an emerald gives it green appearance. A very little amount of chromium is blended with Beryl during the process of composition. To make sure that an emerald ring always keeps on shining, oil is used. The experts strongly believe that oil helps in intensifying the green color always making its appearance alive. The emerald owners must note that keeping an emerald in ultrasonic machine can take its oil off and would lead it to look dull. So it is advised that one should use a soft piece of cloth to clean a gemstone like emerald.

Emerald rings can even be more expensive than diamonds if they are of the superior quality. The highest quality emerald has the inclusions, which cannot be seen with naked eyes. Jewellery experts use a magnifying glass to see those inclusions. The green colour which is the pride of an emerald is also used to determine its quality. The darker the green colour is, the better the emerald is. An emerald ring is something which is too fragile to be broken into pieces. You dedicatedly need to take care of your emerald ring in order to protect it. It is advised not to wear it while you are doing something like sports. Even while you are doing household chores, it is better to keep it aside and then work.

The rich green emeralds which are used in the manufacturing of emerald rings are found in Columbia. Now the world knows them by the name â€˜Columbian emeraldsâ€™. History also tells about th American jewellers who once found stones which had Vanadium as the major constituent. Later on, these stones were called as â€˜Vanadium emeralds.
