Article published on March 5th 2012 | Management

Making high and lofty buildings has become a famous business among the manufacturers. With the rapid growth of technology and construction materials, industries and factories are growing very fast. One of the latest trends for some years is building a steel building. Most of the industrialists are choosing steel buildings and making them built by the builders. This new age building material surpasses the age old concept of buildings made of bricks due to various reasons.

It takes a lot of time to make the common buildings. The usual buildings are a source of air pollution in the environment. The builders take a hell lot of time to make and construct the usual buildings. Also, these buildings involve a great amount of money because the materials used to make a traditional building are highly expensive and they are not flexible to use for locomotive purposes.

However, it is easy to construct a steel building and such a lofty building can be built very fast. The financial cost that is involved in making these buildings is also reasonable, and lower than the usual buildings made of bricks and stones.

In what ways are steel buildings advantageous to construct?

Building a steel building is very easy and most of the promoters depend on this business. They are lighter and are not troublesome. Secondly, the material steel does not easily catch with fire as compared to the usual brick buildings. Thirdly, the metal steel is recyclable to the extent of 66 per cent and is very ecological and environmentally resonant. Other construction materials are not at all eco-friendly. Fourthly, steel is very much sturdy and steel buildings are therefore very durable, and can easily endure the terrific and harsh weather conditions like earthquakes, heavy winds, massive snowfall, and the adverse hurricanes. Finally, building a steel building is very beneficial as they are resistant to rotting, cracks, cutting and breaking, creeping and termites. Therefore, almost all the builders select steel buildings as they are hazard-free and easily built.

Clear span frames, single slope frames and modular frames are the three types of steel building frames. In these cases, the steel buildings are of great strength, durable and economical. These frames generally do not require interior wires and so are the most ideal. They are used in factories, sport complexes, storage areas, shopping complexes, office buildings and so on. They are generally very economical and give a wider space to the interior rooms.
