A Glance at the Guidelines that Lead to ISO 9001 Certification by Barton Wilson

Article published on June 11th 2012 | Business

Today's global business setting is ruled by standards that ensure the quality and safety of goods and services. One example of this standard is the one released by International Organization of Standards: ISO 9001. ISO 9001 concerns the implementation of quality management systems to aid organizations meet the expectations of customers and other stakeholders. With around a million firms licensed under this standard, ISO 9001 is remarkably suitable as a measure of conformity and competitiveness in global economies.

There are numerous reasons why itâ€™s a plus to be registered with ISO 9001, and why several organizations from different industries aim for this certification. First, a quality management system assists in making business processes more effective, contributing to greater productivity while lessening errors, wastes, and expenses. An ISO certification gives a business global approval, permitting it to manage different markets. Above all, the enactment of the standard produces quality services and goods that bring delight to clients.

There are procedures to be taken in becoming an ISO 9001-certified organization. First, a company fills up a form and gets a copy of the ISO 9001 manual through an independent accrediting body. At this stage, a company may employ an advisor that focuses on arranging the organization for the steps which lead to accreditation.

Preparing the business to fulfill ISO certification 9001 standards implies carrying out a pre-audit of the business and verifying which processes do not meet ISO 9001 standards. This review is followed by the creation of a quality manual which will guide the management in implementing the quality management system. This system is actualized by staff and training managers in attaining the procedures of the quality standards. The business then executes a pre-certification audit to see if it overlooked any key points in the manual.

Once a company observes itself all set for ISO certification, it can go to an independent accrediting body to arrange a first assessment audit. The auditor provides the organization an audit plan no less than four weeks ahead of the date of auditing. Following the audit has been carried out according to plan, the auditor makes a report, which will be examined by specialists for evaluation. If a company passes the review, it still needs to carry out typical internal audits to maintain the certification.
