Article published on March 15th 2012 | Business

Mold in the environment shares the same role as fungi: they decompose dead organic matter to fertilize the earth. With the lack of chlorophyll, the stuff that allows plants to synthesize light and turn green, they â€œfeed on the deadâ€• to survive. They are not really bad but of all the places that they could grow, they choose the dampest place in your house.

Experts consider mold as both a home and health risk, with thousands being affected yearly by property damage and asthma. An article by USA Weekend reported that one in every twelve adults is diagnosed with asthma, which can be triggered by allergens like mold. Donâ€™t let the mold just sit there; take immediate action.

According to the Environmental Protection Agency (EPA), there is no way to totally eliminate mold and spores that grow inside the home. However, the EPA points out that you can kill the mold by controlling the amount of moisture in other words, by waging a war of attrition. Destroying the moldâ€™s preferred habitat conditions will inhibit its growth in the house, thereby averting any home and health risks.

In areas like Michigan where summers can be very humid, a useful trick for controlling mold is by reducing humidity levels to between 30 and 60 percent. It also pays to check if there is a leaky pipe or a damp source in the house that may be sustaining the mold. Any concentrations of moisture must be cleaned within two days to prevent mold formation.

Ventilation also plays a key role in mold remediation Michigan residents require. Since the air is a natural carrier for moisture and mold spores, letting air in and out will reduce the chances of mold growth and formation of moisture. Blowing air can dry damp areas and deny mold spores a place to stay and grow. Windows, air conditioners, and exhaust fans are some examples of ventilation systems you can use.

Provide adequate ventilation for every part of the house, especially in places close to sources of water or moisture. For example, the basement is an ideal place for mold to grow because it is cool down there. Michigan mold remediation services check the basement and other parts of the home with a thorough inspection.

Do not let your loved ones suffer from home and health risks brought about by mold. The right way of mold removal Michigan residents practice can go a long way to ensuring your familyâ€™s health and safety. Visit the EPA website at www.epa.gov for more information on home mold remediation.
