Article published on April 9th 2012 | Business

Let's say you're a professional in a large company. Your particular responsibilities include ensuring all of your workers possess the proper software and hardware they should be do their jobs. Buying PCs for everybody isn't enough -- you also have to acquire software or software licenses to offer personnel the various tools they might require. When you have a new employ, you must buy more computer software or make sure your existing software license allows another user.

Before long, there may be an alternative for executives just like you. Instead of installing a suite of software for each and every personal computer, you'd only have to load one application. That application would allow employees to log into a Web-based service which serves all of the programs the user would want for his or her job. Remote machines owned by another firm would run from e-mail to word processing to complex data analysis programs. It's called Denver cloud computing, and it could alter the entire computer marketplace.

In a cloud computing system, you will find a considerable work load change. Local computers no longer need to do all the heavy lifting when it comes to managing applications. The network of computers that make up the cloud deals with them alternatively. Hardware and software demands on the user's side decrease. The only thing the user's computer ought to be able to run is the cloud computing system's user interface software, that may be as basic as a Web browser, and the cloud's network takes care of the rest.

There is a good chance you've previously used some type of cloud computing. For those who have an e-mail account with a Web-based e-mail service like Hotmail, Yahoo! Mail or Gmail, then you've had some experience with cloud computing. Instead of running an e-mail program on your pc, you log in to a Web e-mail account remotely. The software and storage for the account doesn't exist on your desktop -- it's on the service's computer cloud.
