Article published on February 3rd 2012 | Business

Many businesses are looking for hosting solutions for their IT department, but they arenâ€™t sure what all of the technical descriptions mean. Certain concepts, especially virtual private cloud servers, may seem difficult to understand. However, any business will benefit from hosted server services after they understand the power of cloud computing.

A virtual private cloud lets businesses try cloud computing on their own terms. With clouds, businesses do not have to know the configuration of an IT system or even its physical location. Businesses can access software, store data and manage communications without hiring an IT staff or keeping a large physical server on the premises.

Instead of buying equipment, users will pay the hosting company to take care of their cloud computing needs. Companies pay for managed cloud hosting on a contract basis and can create their IT budgets according to their needs. Private cloud solutions will provide the scalability and reliability that businesses need along with the security to protect proprietary information.

For companies who want to purchase their own physical equipment, a colocation data center provides a solution. With colocation, the company owns the equipment, but data center providers take care of the IP address, bandwidth and power. Companies save a significant amount of money on bandwidth and enjoy greater reliability. Companies can also upgrade their equipment when they want to and are not dependent on the provider to keep the latest technology in-house.

To find out more information about cloud computing, managed hosting and colocation solutions, visit http://www.gnax.net. Interested businesses can chat live with the sales staff to learn more about the company and its services.
