Article published on January 20th 2012 | Business

The biggest drawback while working with the flex circuits is that people often canâ€™t properly realize what it needs to start up the work properly with them. More often than not, the supply chain teams treat them as like any other ordinary commodity and pays little time and heed to it. The consequences of such negligence can never be good..

In general there are five common mistakes that are related with the working with the flex circuits. The first of them is not choosing the best PCB supplier for your company. While choosing the PCB supplier for your company, go through the uniqueness and capabilities of the company. Your budget, the amount of money you save or mere assumptions that they can deliver the goods to your company should never be the criteria of the selection of the company.

Designing of a flex circuit is no easy job at all. The initial plan of designing the circuit will never come up with so many problems when you actually start to built it. Taking the help of your supplier is really beneficial as he may come up with reliable circuits that can be built without much fuss.

PCB CAD software should not be totally relied on to design the initial blueprint of the flex circuits. There are high chances that errors will creep in which may not be identified with our naked eyes. Sharp edges, corners and various other points deserve a more human touch.

It is quite often seen that the flex circuits are built after all other necessary works have ended. With so little time to build it, shortcomings are bound to appear. Not properly identifying the limitations and faults of the circuits is another drawback of working with it.
