# Data Recovery 101: the Magic behind Hard Drive Recovery Services by Ruby Badcoe

Article published on April 16th 2012 | Business

If there's one fact about computers everyone knows, it's that hard drives are bound to fail. A computer's hard drive is its main, and typically largest, data storage or more popularly known as "Drive C". If the hard drive gets damaged by any chance, you could lose everything on your computer.

Hard drives have a general lifespan of five years, but many tech experts recommend changing them every three years to be on the safe side. Before understanding what causes hard drives to crash, it's wise to know how they work first. Hard drives are typically comprised of several key components which are the case, platter, drive motor, drive heads, and a logic board. The case provides protection from the environment; the platter holds the magnetic media that stores data; the drive heads read and write data to the platters; and lastly, the logic board controls how the drive interacts with the rest of the computer system.

The most common hard drive failure is a head crash, which occurs when a drive head comes into contact with a platter. When this happens, the magnetic media will be scraped off of the platter, making both the data and drive head inoperable. Another typical drive failure is when the disk fails to properly hold the magnetic alignment, which renders data inaccessible.

Recovering data from failing hard drives is something not every computer user can do on their own. It involves technical expertise, and an average IT guy is not ideal for the job. In times hard drive-related despair, it is best to rely on data recovery firms.

Data recovery is a booming sector in the industry. Los Angeles is thankful for data recovery firms because the city is driven by international trade, entertainment (television, music, motion pictures), technology, fashion, apparel, and tourism. If data from these industries disappear, it can be catastrophic. The best way to prevent the worst from happening is to find professionals who provide hard drive recovery Los Angeles companies are thankful for.

hard drive recovery Los Angeles City needs is essentially the process of backing up or finding data lost either due to deletion or hard drive failure. Recovery significantly depends on how long ago data loss occurred. DIY endeavors are discouraged on hard drive repairs because these may aggravate the condition.

The hard drive is like the computer's mind; take it off and the whole body becomes useless. Data recovery companies that offer hard drive recovery Los Angeles residents recommend can help you recover data efficiently and quickly. To find a list of data recovery companies in your area, visit DataRecoveryCompanies.com.
