Electric heating is an important part of our lives all year round. In countries that face very hostile drops in temperatures, electric heating is even more essential. Depending on what heating tasks are to be undertaken, one can opt for a suitable heating system—right from the basic ones for home use to more advanced ones for industrial heating. One can choose from a range of heaters such as electric convector heaters, electric heating fans, electric fires, electric radiant heaters, plinth heaters among many others. However, the electronic panel heaters are among the most preferred types of heaters because they can be easily installed and are suitable for use in different kinds of places. They provide consistent heating and heat the room very quickly without taking too much time. Hence they are suitable for small homes because one heater will meet all heating requirements.

Now let's take a look at the various advantages of electric heaters:

- * **Economical:** These heaters are available in pocket friendly prices. The basic ones are very affordable and the prices advance as these heaters get feature-rich. They can also be installed at low costs and do not require much maintenance. To top it all, they last for several years—so this one time investment gives good results.
- * **Durability:** Since an electric heater does not comprise too many moving parts (except for a fan maybe), there is not too much wear and tear taking place in the heater. This means that a heater will last well over a decade with just the basic maintenance.
- * **Safe and secure:** When it comes to electrical appliances, safety is always a major concern. These heaters are well insulated and made in accordance with the industry safety standards. Also, since there is no question of fuels burning inside these heaters, chances of leakages, explosions or emissions are as good as zero. They are safe to use around the house. Kapton heaters are preferred heaters because of their flexible circuits.
- * **Comfort factor:** These heaters provide a lot of comfort and coziness. Many of these heaters have features such as temperature control and thermostatic controls that emit only as much heat as is required. This ensures that there is no over-heating or heating deficit either. Hence the same heater can be used in different temperature conditions as well.
- * **Easy maintenance:** Since one does not need to call in engineers to inspect these heaters on a regular basis and there are no inspections required, these heaters are hassle-free to a great extent.

Kapton heaters are among the most popular heaters because of their flexible circuit features. Hence, electrical heaters are the most preferred solutions for comfortable winters.
