Energy Audit can be a beneficial decision for an organization

by Ashish Pandey

Article published on May 2nd 2012 | Business

The main idea to conduct the energy audit is get information regarding important things such as improving energy management and getting the baseline according to which the management initiative results can be measured. There can be various benefits of the energy auditing that you can enjoy and these include financial benefits, operational benefits, environmental benefits and marketing benefits. When you go for an energy audit in your company or an organization, you focus on the opportunities that lead to energy conservation.

The first and foremost benefit of energy audit is financial benefit. With energy auditing, you learn how to save energy, which in turn leads to reduced expenditure. You save fuel and conserve energy, which directly offers you lower cost on the energy expenditure. Also, you get reduced maintenance, which means that you get fuller utilization of plants or machinery in your organization. Additional costs such as water charges are also reduced considerably with the help of energy audit. It also helps in bringing down the expenditure of the capital. Additionally, energy auditing enables increased productivity because of better working conditions.

The other kinds of benefits that you may receive with the energy audit are operational benefits. These can be had by achieving building optimization. But finally, these will give you financial implications only. However, the information for the management regarding the costs of the energy saving can be crucial from the point of view of operational benefits. This can also result in effective decision making as well as planning.

The obvious benefits are those related to environment. It goes without saying that the energy auditing can lead to environmental benefits. It considerably reduces the emission of carbon dioxide from your operational site. Reduced environmental impact from your organization can result in transmission, transport as well as delivery of the energy. Also, it results in reduced national and regional energy demand. Finally, energy auditing can lead to conservation of the natural resources such as non-renewable fuels and fossil fuels.

It is very important that the right measures should be adopted to improve quality of working environment. The focus should therefore be more on the quality of working atmosphere rather than the reduced energy costs. For example, the focus during the energy auditing can be on changes of the temperature, lighting levels and humidity. This can considerably change the working environment. Also, the focus during energy auditing can be on the space conditions.

More and more companies in the present scenario are inclined towards the green decisions such as energy auditing. This also makes good marketing. Change in climatic conditions is quite apparent and so, it is very important that good marketing decisions should be taken for energy auditing as well because more and more customers will look for the green business. The organizations which are inclined towards green saving through energy auditing are better and can help you in a lot of ways, just like the ones mentioned above.

Also, such organizations are seen as more responsible and can therefore be good in the eyes of the employees and customers as well.
