Good morning people, where is your awn located? An awning is also known as the overhang that is attached to a buildingâ€™s exteriors. It has the components of canvas woven of acrylic, or cotton polyester yarn. Mainly, it is stretched over a light structure of aluminium, iron, wood, transparent materials or at times steel can also be used. Commonly awnings are fixed above windows, doors or along sidewalks if more columns are added they form canopies, which form an extension. They are used on hotels entrances to create more space for dining, reception, and for parties. For commercial buildings, these are used as form of advertisement.

Awnings date back to Egyptian and Syrian civilization. They come in different types, which include; propulsions awning that involves manual operated models, which are opened by hands or the motorized models that operate using electricity. Each has its own pros and cons raging from low prices that are affordable, to ease of using them. The wind tolerance and construction awnings are commonly used for wind tolerance. The length, width and number of supporting arms and the type of material used is also important for it to be able to withstand a great magnitude of wind. They are mostly steel and the modern kinds have incorporated wind sensors. They are commonly found in prestigious places.

The aluminium awnings have been the most used by many residents across the world. They come at a variety of colours for one to choose from. The popularity is believed that they provide cooler shades in homes, meaning that furniture and equipment can last for a longer period. Retractable awnings are also used by homeowners due to high-energy costs and lack of air conditions in most countries across the globe. Lantern awnings are fitted on walls that spread the load across the width of the wall. These have a motor fitted on the roller tube. Many of the motors have an inbuilt receiver, which is remotely operated. Lanterns are quite effective as and they are suitable for a large outdoor space compared to others awnings.

Windows use the side or drop-arm type of awnings. Awnings without sides come in different styles to suit the varied tastes of consumers. However, those awnings without wings do not provide the much-needed shade, compared to the awning with shades. The drop-arm awnings come fixed with rolled tubes at the top and contain motors and also they have thee wind sensors.

Caravan awnings are popular in many European countries, particularly Britain. They are used to expand peopleâ€™s living places. They have many benefits, which include; they are cheap to buy and are good for providing more space without having to look for a big caravan. They are easy to set up using the manuals. They are light in weight, making their transportation easy. Flexibility is important and these caravan awnings provide the opportunity for you to fold the window and doors to a desire you are comfortable with, thus, enabling free flow of air.
