If you are using a HD TV, it means you are very particular about the video quality that you want for your TV viewing experience. But the HDMI transmitter can spoil your experience if you do not put proper though into it while selecting the company that you purchase the hdmi over coax from. The transmission system of the device is its USP and that is what you need to look for. The system can be quite costly at times, if you fail to choose the proper brand and the proper wires for it. It can sometime be a complete wastage of money if you purchase a cheap device for the transmission to happen but find out that it does not deliver the promised output.

It is important to know the purpose of the technology while purchasing and implementing the device. The device can convert the HD signals to a balanced signal which is different but can be carried through wires and then at the receiving end the signal gets converted again to HD signal delivering the proper output. The risk of losing the quality in between is high if you do not use proper technology and good device for the conversion.

My first suggestion to you would be to go through the review of the product before spending on it. You need to be sure what quality of output is possible for them to supply. The brand name plays a major role because no brand would risk their name by supply bad quality in the devices manufactured by them. The signal quality is the indication of quality and you can ask for a demo for the same before actually paying for it. It is important to know the specification of the device.
