LCD Television- Experience the Insight of Technology by Julia Roger

Article published on April 2nd 2012 | Business

Led television is known for its brighter image view and high-class picture quality. If you already had a glimpse of all the fabulous photos of an LED TV from the catalogues and you are all set to buy one of among them. You should at least know the key factors about the technology first. LED Television is truly an LCD television that has extra technology added. LED are well known as Light emitting diodes that are a proficient source of light while the LCD screens can be used as fluorescent tubes. Some of the LEDs are used to glow up the LCD display.

These incandescent tubes provide illumination, but they have a few drawbacks. Such lamps capture more space and are heavy in weight. These lamps are not able to offer adequate color quality because of the black color display. This is the very basic reason that LED technology came into existence. There are couples of LED TVs that are available to the consumer. One of among them is the black-lit model that allows the LCD display to be lit up by back lightning through a large numeral of LEDs positioned behind the TV panel. The other one has a split during edging lit side that uses LEDs as a radiance source positioned around the ends of the television screen.

If you are using LED as a backlight then it requires a lot of space in the back of the television set making the TV thicker in size. However, the edge lit LED display requires a smaller amount of panel space at the backside and hence the design is much slimmer and smooth. Some of the other useful feature of the edge lit LED is that it consumes less amount of energy as compared with other sources. This is good from the environmental point of view and hence in turn saves your monthly electricity bill. This makes it possible that the television set can play all your favorite items from the computer including the internet websites and you can watch online movies as well. Thus, LCD television is in huge demand these days.
