Article published on July 20th 2012 | Business

LED screens use light emitting diodes to provide high quality and brightly lit video LED screens displays. LED screens are made up of tiny LED lights and in comparison to LCD screens, LED screens are much brighter as each pixel contains a cluster of blue green and red LEDs which light up to create the exact colour which helps define high definition images.

All televisions are made up of individual pixels however a pixel is larger in LED screens which contain very small bright lights and the further away you are from the LED screens, the pictures have more clarity. LED screens are popular for main event shows for the crisp clear pictures on screen from the full luminosity of the back light shining through.

The technology in LED TVs is completely different to those used in LED screens which causes a lot of confusion between the two so when looking for LED screens either to buy or to hire it is important that you know the difference in case you end up asking for a quote on an LED TV instead of LED screens. An LED TV is the same as LCD TV however the backlight of LED TV uses individual LEDs instead of a fluorescent tube light.

LED screens are popular amongst retail, sports and entertainment industries for the installation of mobile LED screens, indoor and outdoor LED screens, remote access to screens for motor shows, major sporting events such as cricket series matches, olympics and racing festivals and other outdoor events such as music festivals.

LED screens more often than not are more favourable over LCD screens if the big screen rental will not be used for close viewing or indoor environment as LED screens are more suited to for outdoor areas and making a dramatic impact. The benefits of LED screens are its brightness, strength and impact.

LED screens are designed to be bright and visible even when the light is shining on it in contrast, the pictures on LCD screens are not viewable when the light shines on LCD screens. LED screens are more reliable and less fragile than LCD screens making them easier to transport and durable.
