Let Us Know the Parameters for Selecting Reliable Electronics Component Suppliers by [Chipchecker](#)

Article published on May 30th 2012 | [Business](#)

“In business, you get what you want by giving other people what they want”- says a meaningful quote about business. However, the inundation of the market with cheap replicas is leading to humongous losses for businesses worldwide. The electronics industry is one such industry that is bearing the brunt of these low quality replicas. Electronics play a vital role in our day to day lives, look around and you will find circuits, resistances, diodes, embedded chips, transmitters and motherboard in almost every gadget we use. However, most manufacturers are realizing the importance of quality electronics products and are roping the services of electronics component suppliers. These suppliers are the ideal bridges for consumers and manufacturers in the supply chain management

In the section below, we have discussed several parameters to analyse before seeking the services of Electronics Component Suppliers -

Testing and staff: Most manufacturers would agree that when it comes to testing or quality assurance, it is practically not possible to check the complete shipment. Therefore a manufacturer or supplier should look for a supplier who offers quality testing services for the various products. In addition to these the supplier should also have a competent support team that is well versed with various components, their working and the various issues that may arise in these components.

Vast inventory: One of the parameters to look for in a supplier is whether they have a vast inventory of components. In case if a component is missing and its not available, it will only result in more time being lost for a consumer. Many suppliers also go a step ahead and stock obsolete electronic components that are no longer in use due to advanced technology or change in policies. Moreover in many cases it is possible for products to get damage during shipment, in such cases the supplier should be able to come up with immediate supplies.

Strong supply chain: It is imperative for every manufacturer that its product should reach the market and attract the maximum number of consumers. Since suppliers are the bridge between them, these suppliers should have a very strong supply chain that is spread in numerous countries.

Prompt delivery: In today’s competitive world the quality of time cannot be undermined. Therefore the electronics component supplier should ensure the timely delivery of components to the consumers. Moreover it should be transparent about its various terms and conditions of shipping.
