For many of us, DVDs are the main supply of movies. But due to the busy life that we lead, it is hard to watch those DVD. So our DVD collection grows, but we cannot watch them. But there are a lot of spare times when we travel or when we wait for something or when we are spending a lazy hour at office or school. Those are great times to watch those movies. However, you will need a DVD player or DVD ROM and a TV for that. How are you going to manage that on a bus or train or in your school or office? That is unpractical as well as unnecessary.

What you can do instead is to have those DVDs on your handheld devices. So, whenever you got some spare time, you can just put your earplugs on and start the movie on you handheld. Nobody will be disturbed and you will be able to enjoy the movie. But how are you going to use a DVD on your handheld device? There are no DVD players attached to it. DVD players are much more larger than your handhelds.

You can try copying the DVD contents. But there are two problems in doing so. First of all is the DRM protection. DRM means Digital Rights Management. It tries to make sure that copyright protection is maintained for digital contents. However, it creates restrictions for legal owners. DRM cannot identify a legal and illegal user; therefore it prohibits some actions for both kinds of users. So, legal users get trapped in this process and are unable to perform some rightful tasks. This DRM protection, if available on your DVD, will prevent you from copying the DVD contents. Copying, editing or extracting audio from DVD movies is something that you have the full right to do so. You purchased the DVD with your own money, so you can do whatever you want with it as long you do not redistribute it. You can do those tasks for personal use, but DRM prevents that also.

If you manage to remove the DRM, then the second problem will arise. DVDs use VOB video format. VOB format is used in all the DVDs that contain videos. But this format is unsupported in handheld devices. Also, they are of very big size. Even if they were supported, you could import only one or two movies depending on your memory card size. So, if you wish to import DVDs into your handheld devices, you will have to remove the DRM and then rip the DVD movie into a supported video format with small size. Removing DRM sounds difficult, right? Not at all, it is actually a very easy task. This task can be done easily by MacTheRipper and for free.

Mac the Ripper or MacTheRipper is a free DVD ripper. It is supported in Snow Leopard and Lion OSX also. This DVD ripper can remove any kind of DRM protection from your DVDs. Once you are free from the DRM, you can then rip your DVDs to your desired format and enjoy them anywhere.
