Article published on July 13th 2012 | Business

HPLC or High Performance Liquid Chromatography is a powerful analysis tool and is used for identifying, quantifying, and purifying individual components by separating a mixture. A workable HPLC consists of a sampler, column, data processor, pump and detector. Due to the high level of applications a new system can cost you a fortune. Hence, majority of the people prefer using refurbished HPLC systems which are available at a reasonably low price. In addition to this, a refurbished HPLC or used HPLC equipment is a highly reliable device that can be used as a back up in times of need.

The process of refurbishing ensures that a used HPLC device retains the same quality standards as that of a new one. All the used HPLC equipments are carefully tested and calibrated to ensure the best standards of security and performance which will allow the users to carry out their analysis in quite a comfortable manner. The price at which the used hplc systems are available is highly competitive but certain points need to be kept into consideration while purchasing such a system.

Before making a purchase, make sure to get the feedback of other users in terms of vendorâ€™s support capability, maintenance cost, future possibility of up gradation, and so on and so forth. In addition to the feedback, also look out for hands on experience and a demo of the instrument. The life of the equipment is extended as a result of using used systems along with an easy availability of their spare parts in the market. As the entire HPLC equipment is made by combining several different parts, it is essential to check the specifications of all the parts to ensure that the system works efficiently. Pressure is an important characteristic while operating a refurbished HPLC. So, keep sure to keep a tab of pressure while operating the machine.
