Protect Your Valuable Items with Rubber Bumpers by Maria Gini

Article published on March 30th 2012 | Business

A wide assortment of rubber bumpers is available in unique styles, materials and sizes from manufacturers like Clifton Rubber Co. Ltd. These may or may not be made from rubber extrusions. If you are confused about which kind of rubber bumpers would suit your specific need, these manufacturers have a customer care department to take care of your worries and to answer all your queries. Polypropylene and polyethylene are also used at times in the manufacture of rubber bumpers apart from thermoplastic rubber.

The electronics industry - such as hard drive foundations to make them shock resistant - communications, medical equipment, security, household goods and consumer product sectors are some of the application areas of rubber bumpers. Their greater utilitarian purpose in functioning as a protective layer on almost all valuable articles is due to the ability of rubber bumpers to reduce vibration and movement in equipment, and stop rigid parts from harming one another due to friction. As the bumpers are used to make products stable, they are also called rubber feet. You can also find rubber feet in toy parts, industrial parts, vehicle parts, motorcycle parts. Most of the rubber bumpers have anti-slip and anti-vibration properties to provide safe protection to both your precious appliance and the floor.

Many kinds of rubber extrusion products also serve to protect goods or even add stability to transport systems. These include the usage of rubber extrusions to trim the interior of mass transit trains and in sealing applications of the aerospace industry. The quality and the capability of the machines used to make the rubber extrusion products will define their reliability and safety measure. This is especially true of products like the tubing used in the diary industry and in medical equipment.

Rubber extrusion products can range from rubber gaskets, exhaust collars, pump discharge hoses and cabinet seals, to drain tubes, pressure switch tubing, connectors and rubber bumpers. The price of the product will depend on the intricacy of the item, as well as the volume of the order since economies of scale reduce costs. Just remember to find a manufacturer who will make sure that every detail of the product is according to customer specifications.
