Hydrocarbons Refrigerant, are these days one of the hot news there are several reasons for this one of the major reason is that the protective layer known as ozone is being depleted and due to this factor people are getting several disease which were once stories now they are becoming reality.

So taking this into consideration scientist worked hard to get rid of this problem as it is becoming a dangerous thing because more the ozone is depleted more we are naked to harmful substances and to avoid this natural protection being destroyed.

This is the theme which college of climate change is working on to provide maximum facilitation by providing such kind of Hydrocarbon which are natural to use and non harmful for the ozone as well as for the environment itself. They have introduced the new latest technology in Hydrocarbon Refrigerant; in this technology the college of climate change has replaced the old Hydrocarbon which were namely as R134a and R12 but now these Hydrocarbon are obsolete due to their harmful disadvantages, this is why new improved technology that is RED TEKÂ® 22a, of thermofluid technology which is the latest and improved form.

The improved form means that they are not only environmental friendly, ozone friendly, but they are highly efficient in working and provides more cooling and more efficient. Besides this there are several other things which differ these, Hydrocarbon Refrigerant from the old ones like they donâ€™t create global warming some people might want to know some other advantages as there is now a trend of those things which are either recommended by some specific authorities or are approved by the respected authorities.

Therefore let me cite here that this advance technology Hydrocarbon are fully in accord to the standards of the United Nations Montreal Protocol; the organization that controls that substance that are the source of depletion of the ozone or can cause damage to this. Furthermore it has been certified by the green peace organization. In addition to this it needs no approval from the EPA as the rule that if the product is friendly to the environment it donâ€™t need any kind of reporting to the EPA as it is the replacement of old technology.

If you need any further information about these Hydrocarbons refrigerant you can visit hydrocarbonsaustralia.com.au call at (08) 6142 0799 or if you want to email you can email at info@collegeofclimatechange.com.au
