Article published on May 8th 2012 | Business

The concept of quick coupling is highly used nowadays. More and more contractors are looking after to use this technology in construction. But as the usage of quick coupling has increased, it has lead to more accidents in past few years. Quick couplers have made the overall construction process easy and these hydraulic devices make it very easy to connect a bucket with the arm of the excavator. These are available in different type of designs and they are capable of accommodating different types of manufacturing equipments. In this article we are going to discuss some important safety tips that will help you in handling these quick couplings.

Train your operators: The first and foremost important thing is to provide proper training to your operators about handling these couplers. The training should cover different aspects of using this system including visual inspection, testing connections, evaluating connections, and engaging procedures.

Upgrade your equipment: There are different types of coupler designs offering safety features which help in preventing unexpected falls or accidents. It is best to upgrade your coupler devices for enhancing the overall safety of your device.

Maintenance of couplers: Make sure to make regular inspection of your couplers and maintain them from time to time. It is best to inspect these couplers before every single use and take care of some precautionary steps like ensuring the position of the safety pin. Your operator should inspect the safety pin manually before using the equipment. Safe operation of the system must be ensured prior to use. Regular maintenance will prevent deterioration of the couplers and it will help you in identifying weak links in the overall machine. Practice strict safety measures before every single use of the quick couplings. Safety is the most important thing to take care of.
