Satellite Dish Service Provides Clear Signal by Julia Roger

Article published on July 25th 2012 | Business

The satellite dish TV is not new in the west, but now it is becoming extremely popular in the eastern world also and people are realizing how the dish TV is much better than the cable lines which only cause cluttered wires and low connectivity. This has happened because now catching the TV signals is much easier through direct satellites than the limited connectivity cables. As this trend is being taken by countries and people like a wild fire, a lot of satellite TV-connection providing companies have emerged. These companies are trying to attract people to adopt their services at low prices by providing high definition quality and sound.

One of the main components of this system is the Satellite dish, the specialized antenna which receives the radio signals, transmitted by the satellites that are orbiting the earth. The connectivity of these dish TVs is high as the line of sight and range of people is very wide because of the presence of the satellites. The companies which provide these connections are also called Direct Broadcast Satellite providers and most people get their antennas installed by the professionals working under them, while some people prefer doing it on their own. These companies bring more than hundreds of channels together, and also provide packages that contain specific programs of the viewerâ€™s choice.

The Satellite receivers is another important component of this system and it performs four main functions. They are decoding the encrypted signal or the message, taking the MPE-2 and MPE-4signals and converting them into standard analog signals that a television can decipher; not only this, they also extracts the individual channels from a larger satellite signal. Satellite receivers have made transferring signal quite easy and now it is used to make the transmission easier all over the world.
