Save on parking garage lighting cost by using the induction lighting technology by Paul Pepe

Article published on August 13th 2012 | Business

With the current cost in the energy and maintenance of the light bulb, many people are looking on many options that they can use so that they can reduce the cost. This need is felt more for the indoor parking garages where the lights have to be put on without stopping. Since most of these parking garages have the bulbs that are mounted on the ceiling, they need to have regular maintenance which cost more. The traditional lighting also may cause the yellowing which may prevent the security cameras to take recognizable or clear images. This is why the American made induction lighting is the best choice when it comes to the parking garage lighting. This is because of the following reasons.

The cost: when you use such lights, you will save since they can use up to 50 percent less energy compared to the metal halide fixtures. They can also last long, they have been proven to last at least 100,000 hours without stopping. This is a long life compared to the ordinary florescent technology or metal halide. It has better light output and it can keep up this light for a long time which is not the case of the metal halide technology. It is able to produce white, clear and crisp light. The customers will be able to see better while the security cameras also can record better images.

When you use the induction lights, you will not have any problem of replacement. You may need to change only once the induction bulb where you may need to change at least 5 or 6 times the metal halide fixture lamps. The lights do not need time to warm up like the high pressure or metal halide lights which means that the lights comes on instantly. The lights also can come with the motion detectors or dimming feature which can save at least 50 percent of the energy if there is no motion detected. There is a wide range of selection that you can use for your underground garage lighting. They come from 40 to 100 watts and they are in square or round designs. You can also get the induction flood lights for your parking garage outdoor level. When you use these lights, you will be able to see vivid and brighter colors. Another benefit that you can consider when it comes to the induction lights is that they are maintenance free for 20 years. The lumens in a induction light do not depreciate 30% for 15 years opposed to metal halides that depreciate 30% in 12 to 18 months. With these benefits in mind, you will not need to be convinced again about using the induction light for your parking garage.
