Server Room Monitoring: Keep Your Server Safe by Julia Roger

Article published on March 23rd 2012 | Business

Server is the heart of many companies and it is important for the proper functioning of any business. If something goes wrong with it, the entire functioning of the company can be disrupted. Thus like all the other equipments and things server needs proper maintenance and there are server room monitoring systems to help you out with that.

Some of the main parameters that server room monitoring will monitor are temperature, humidity, airflow, power, smoke etc. Each of these parameters if not controlled can result in many problems thus one must take care of it in advance.

As per the working, there are different devices used for it and those are easy to install. Some gives you choice to integrate it with your current Server Network Management Protocol (SNMP), which is a popular protocol. It is used to manage network devices from a particular central location. Then there is Intellipool Network Monitor INM, which is a web based network monitor that helps you to report, monitor and alert errors on your server.

In case the server room monitoring system detects a problem or if something goes wrong you will immediately receive alert via SMS or email. Thus, you will be able to tackle the situation as soon as possible.

The most important aspect of security is access control. Not everyone should be allowed inside, only professionals should be allowed. Secondly, one must take regular backups of the works that has been done, as it can come handy in case the server crashes. Installing UPS is also very important.

There are many amazing wireless data logging systems available that can monitor anything from temperature to humidity. It can monitor anything that can affect the system and in most cases, the data can be downloaded too. As per getting these systems and installing them it depends upon the server, the place where it is kept and the environmental factors.
