Bulk material handling is not everyone's cup of tea. It is not possible for everyone to manage huge machines and stocks. There are several equipments that help in material handling in big units as well as projects. The machines such as conveyors, elevators, crusher, stacker and others are used in bulk material handling process. Conveyors are the most used equipments in the material handling process.

There are various types of conveyors available in the market. Telescopic conveyor, screw conveyor, roller conveyor, belt conveyor, chain conveyor and many more are used in large projects. Telescopic conveyors are the latest addition in the list of conveyors. Telescopic conveyors are used for loading cartons and boxes in trucks, railway cars, trailers as well as containers. Telescopic conveyors are available in various configurations according to the requirement of the projects.

The conveyors consist of sliding as well as fixed portion for telescopic actions. The telescopic conveyor gets deep into the vehicle so that baggage's can be installed properly. The telescopic conveyor helps in saving time as well as energy while loading the trucks and other vehicles. Telescopic belt conveyors are most used in the projects that are extremely huge and involve transferring of heavy boxes. Telescopic conveyor can be used in single, double or three stages depending on the need of the project.
