Tents and Marquees: Perfect for Different Unique Occasions by [Sue Mattson](#)

Article published on February 17th 2012 | [Business](#)

Tensile structures as momentary structures are becoming preferred event venues; tents are a good alternative to renting space at resorts, malls, or auditoriums. Tent rental is also watched as a reasonably more affordable way to celebrate weddings, soirees, or parties with buddies and family. Huge tents called marquees are available in different designs and companies that provide them have items ideal for any occasion.

What makes marquees appropriate for programs is their strong fabric and frameworks, which are stronger than the ones used in camping tents. Camping tents are made of insulated flysheets, such as tarpaulin or silnylon. Silnylon is an artificial textile made with silicone and nylon while tarpaulin is produced with woven polypropylene, a plastic material also utilized to make synthetic fabric for loudspeakers, ropes, thermal wear, and carpets.

Marquees, on the other hand, are conventionally made of canvas but are now more often made of polyvinyl chloride. Furthermore, vinyl textiles are good for keeping out moisture, wind, and debris. The poles and framing are made of metal, keeping the tent protected and secure even during strong gusts, permitting occupants to enjoy the party even in unfavorable weather condition.

A lot of businesses that provide tent rentals also rent out high-peak tents as a result of their visual design, which is reminiscent of playful circus tents. These are defined with roof covering elements appearing like cupolas or spires. Their curved design enables wind to flow along the body rather than against it. High-peak tents are commonly white, while there are some high-peak tents with multicolored decoration. High-peak tents can be differentiated from tension tents, as the latter counts on cords to pull the body apart to sustain tension and security.

Many companies that offer tent rentals also rent out frame tents. These are preferred among clients because of their secure design. The framework of frame tents is comparable to that of houses with simple gable roof coverings. Its basic roof framework has roof covering purlins, roof covering beams, and a long lasting ridge. Nevertheless, the roof covering does not have a ceiling, enabling a larger room inside for overhead decoration and lighting. Unlike pole tents and tension tents, frame tents need a secure floor for support. This is helpful for events that call for complex electrical equipment.

Canopy tents and pole tents have like structures. Canopy tents are differentiated by their solitary roof coverings and poles that support them, making them resemble a fabric shed. Pole tents, on the other hand, may be substantially larger and may have a fabric wall with plastic windows. Tent rentals offer these as a lightweight option to frame tents.
