The Relevance of a Virtual Directory Server by [John Schubert](#)

Article published on August 17th 2012 | [Business](#)

You will find many use cases that a virtual directory has. Usually, it is most applied easily to allow the integration of application in an current environment. Here are some of the use circumstances with their description and how a virtual directory can solve troubles within them. The very first use situation is called namespace integration. This includes integrating separate or disparate directories to make or type a single directory. A further use situation is edge directory integration in which the virtual directory server will put with each other specified application directory facts to enterprise directory with no the need to make adjustments for the enterprise directory. The last use situation would be the integration of web services.

Quite a few organizations primarily those with web services can benefit from the use of virtual directory since it may make and update user data. Some organizations have thought of making use of separate program or software program to obtain the capabilities of firewall. Even so, other companies have learned that they need to have not use separate computer software for firewall because they can acquire it simply by utilizing a virtual directory server or VDS. It is like a one-stop retailer in which just about every thing you could possibly need to make certain the safety and overall performance of one's LDAP directories and databases is identified. What exactly is much more fascinating about this technology is it is lightweight in nature and will not consume most of your resources.

Due to the fact the virtual directory provides access towards the recent directory data regardless of the distributed nature of the database or directory infrastructure, the applications doesn't have to be changed when you can find changes in the directory infrastructure. A virtual directory also provides another capability to organizations which includes migrating off from Sun Directory server into one more type of database that the organization desires. This way, the data from the present directory server is often migrated off towards the new database.
